

0DTE nearest-OTM package: per-rule return summary, entry 10:30 ET, one-bar hold, models compared on the same 866 days

	n	mean	std	min	max	skew	ex. kurt	t	Sharpe _{ann}	Sharpe _{ann} ^x
<i>Short volatility (always short)</i>										
all models (no forecast)	865	0.006	0.154	-1.96	0.21	-5.02	43.98	1.18	0.64	-2.44
<i>sign(s) (± 1 on the sign of s)</i>										
baseline (HAR + calendar OLS)	865	0.002	0.154	-1.96	1.30	-0.77	43.06	0.29	0.16	-2.97
block-diagonal ridge	865	0.003	0.154	-1.96	1.30	-0.76	43.10	0.50	0.27	-2.85
block-diagonal ridge, without the FOMC columns	865	0.002	0.154	-1.96	1.30	-0.74	43.08	0.41	0.22	-2.91
LightGBM [†]	865	0.004	0.154	-1.96	1.30	-0.61	43.16	0.82	0.44	-2.68
XGBoost [†]	865	0.002	0.154	-1.96	1.30	-0.67	43.07	0.34	0.18	-2.94
lasso (causally tuned) [†]	865	-0.003	0.154	-1.96	1.30	-0.73	43.00	-0.56	-0.30	-3.41
lasso ($\alpha = 10^{-4}$)	865	0.004	0.154	-1.96	1.30	-0.77	43.14	0.68	0.37	-2.76
elastic net (causally tuned) [†]	865	-0.002	0.154	-1.96	1.30	-0.76	43.00	-0.43	-0.23	-3.35

One trade a day: enter the nearest-OTM package at 10:30 ET and exit thirty minutes later at the next stamp, in the same two strikes. 865 expiration days, 2020-01-03 to 2024-04-30 (the deck's frame). Fills are at the quoted midpoint everywhere except the last column, which is the same rule filled at the crossed spread: entry at the touch (the ask when long, the bid when short) and exit at the touch of the next stamp; the 15:30 leg cash-settles and pays no exit spread, and a re-pick that lands on the same two strikes with the same sign is a hold, not a round trip, so it is not charged. One expiration day = one return; mid fill. Every t here is the plain $t = \sqrt{n} \cdot \text{mean}/\text{std}$, with no autocorrelation correction.

"ex. kurt" is the bias-corrected sample excess kurtosis (Gaussian = 0). The short-volatility rule takes no forecast, so it is one row for all models. Sharpe_{ann} = (mean/std) $\times \sqrt{252}$; every other column is daily. The one column this table adds to the deck's is Sharpe_{ann}^x, the same rule's annualized Sharpe at the *crossed spread* instead of the midpoint; every other column is the deck's.

Forecasts: baseline (HAR + calendar OLS); block-diagonal ridge (HAR block and exogenous block, separate penalties) on the design carrying the FOMC calendar block, and the same ridge on the earlier design without those columns, as a diagnostic row; LightGBM and XGBoost on the all-features design; lasso on the same design, causally tuned vs. fixed $\alpha = 10^{-4}$; elastic net (causally tuned). [†] marks a column still fitted on the earlier design panel; a run of those four on the panel of record is pending. The signal is $s_t = \widehat{RV}_t - IV_{\text{hr}}^2 h_t w_t$: the forecast against the implied variance of the same window. On the bars whose vendor implied volatility is a censored solver node the deck's treatment is used here too — the volatility that reproduces the package midpoint, recovered by bisection over the remaining h_t hours — so every bar carries a signal and no bar sits flat.
