One trade a day: enter the nearest-OTM package at 14:00 ET and exit thirty minutes later at the next stamp, in the same two strikes. 866 expiration days, 2020-01-03 to 2024-04-30 (the deck's frame). Fills are at the quoted midpoint everywhere except the last column, which is the same rule filled at the crossed spread: entry at the touch (the ask when long, the bid when short) and exit at the touch of the next stamp; the 15:30 leg cash-settles and pays no exit spread, and a re-pick that lands on the same two strikes with the same sign is a hold, not a round trip, so it is not charged. One expiration day = one return; mid fill. Every  $t$  here is the plain  $t = \sqrt{n} \cdot \text{mean}/\text{std}$ , with no autocorrelation correction.

“ex. kurt” is the bias-corrected sample excess kurtosis (Gaussian = 0). The short-volatility rule takes no forecast, so it is one row for all models. Sharpe<sub>ann</sub> = (mean/std)  $\times \sqrt{252}$ ; every other column is daily. The one column this table adds to the deck's is Sharpe<sub>ann</sub><sup>x</sup>, the same rule's annualized Sharpe at the *crossed spread* instead of the midpoint; every other column is the deck's.

Forecasts: baseline (HAR + calendar OLS); block-diagonal ridge (HAR block and exogenous block, separate penalties) on the design carrying the FOMC calendar block, and the same ridge on the earlier design without those columns, as a diagnostic row; LightGBM and XGBoost on the all-features design; lasso on the same design, causally tuned vs. fixed  $\alpha = 10^{-4}$ ; elastic net (causally tuned). <sup>†</sup> marks a column still fitted on the earlier design panel; a run of those four on the panel of record is pending. The signal is  $s_t = \widehat{RV}_t - IV_{\text{hr}}^2 h_t w_t$ : the forecast against the implied variance of the same window. On the bars whose vendor implied volatility is a censored solver node the deck's treatment is used here too — the volatility that reproduces the package midpoint, recovered by bisection over the remaining  $h_t$  hours — so every bar carries a signal and no bar sits flat.
