

ODTE nearest-OTM package: per-rule return summary, entry 14:00 ET, one-bar hold, models compared on the same 866 days

	n	mean	std	min	max	skew	ex. kurt	t	Sharpe _{ann}	Sharpe _{ann} ^x
<i>Short volatility (always short)</i>										
all models (no forecast)	866	0.008	0.237	-2.65	0.32	-4.48	32.87	0.93	0.50	-2.62
<i>sign(s) (± 1 on the sign of s)</i>										
baseline (HAR + calendar OLS)	866	0.002	0.237	-2.65	1.63	-1.64	32.29	0.20	0.11	-3.06
block-diagonal ridge	866	0.002	0.237	-2.65	1.63	-1.55	32.31	0.31	0.17	-3.00
block-diagonal ridge, without the FOMC columns	866	0.000	0.237	-2.65	1.63	-1.52	32.24	0.02	0.01	-3.16
LightGBM [†]	866	-0.000	0.237	-2.65	1.63	-1.47	32.23	-0.02	-0.01	-3.19
XGBoost [†]	866	0.001	0.237	-2.65	1.63	-1.48	32.26	0.09	0.05	-3.13
lasso (causally tuned) [†]	866	-0.001	0.237	-2.65	1.63	-1.51	32.23	-0.06	-0.03	-3.20
lasso ($\alpha = 10^{-4}$)	866	0.002	0.237	-2.65	1.63	-1.54	32.29	0.21	0.12	-3.05
elastic net (causally tuned) [†]	866	-0.001	0.237	-2.65	1.63	-1.51	32.21	-0.12	-0.07	-3.24

Distribution of the return of the position taken at 14:00 ET, block-diagonal ridge forecast, one panel per rule (returns inside their 1st–99th percentile window).

One trade a day: enter the nearest-OTM package at 14:00 ET and exit thirty minutes later at the next stamp, in the same two strikes. 866 expiration days, 2020-01-03 to 2024-04-30 (the deck’s frame). Fills are at the quoted midpoint everywhere except the last column, which is the same rule filled at the crossed spread: entry at the touch (the ask when long, the bid when short) and exit at the touch of the next stamp; the 15:30 leg cash-settles and pays no exit spread, and a re-pick that lands on the same two strikes with the same sign is a hold, not a round trip, so it is not charged. One expiration day = one return; mid fill. Every t here is the plain $t = \sqrt{n} \cdot \text{mean}/\text{std}$, with no autocorrelation correction.

“ex. kurt” is the bias-corrected sample excess kurtosis (Gaussian = 0). The short-volatility rule takes no forecast, so it is one row for all models. Sharpe_{ann} = (mean/std) $\times \sqrt{252}$; every other column is daily. The one column this table adds to the deck’s is Sharpe_{ann}^x, the same rule’s annualized Sharpe at the *crossed spread* instead of the midpoint; every other column is the deck’s.

Forecasts: baseline (HAR + calendar OLS); block-diagonal ridge (HAR block and exogenous block, separate penalties) on the design carrying the FOMC calendar block, and the same ridge on the earlier design without those columns, as a diagnostic row; LightGBM and XGBoost on the all-features design; lasso on the same design, causally tuned vs. fixed $\alpha = 10^{-4}$; elastic net (causally tuned). [†] marks a column still fitted on the earlier design panel; a run of those four on the panel of record is pending. The signal is $s_t = \widehat{RV}_t - IV_{\text{hr}}^2 h_t w_t$: the forecast against the implied variance of the same window. On the bars whose vendor implied volatility is a censored solver node the deck’s treatment is used here too — the volatility that reproduces the package midpoint, recovered by bisection over the remaining h_t hours — so every bar carries a signal and no bar sits flat.
